

FABRICATION GRIPS

Wouldn't it be great if someone made a power grip that pulled seams together using Dani-Clamps, Spring-Clamps or a Pinske turnbuckle? And wouldn't it be great if while you were pulling the seams together you could level the joint? And wouldn't it be great if you could hold down 5/16" aluminum straight with those grips? And wouldn't it also be great if those grips could pull down back splashes in troubled areas, aid in manufacturing cove splashes and be so versatile that you could do just about anything with them? Well, we found grips that do just that and more!

These Grips are really the Ultimate Solid Surface Fabrication grips. They feature an 8" Suction pad with a 1/8" steel plate attached. The plate has 1/4" holes around the edge every 22.5°. The accessories bolt to the plate assuring a stable production platform. The Multi-function bracket (the odd shaped one) can be used in three positions for holding straight edges, squaring back splashes and more. It has 1/4-20 threaded holes and thru-holes in numerous locations. The metal lock down ring is also threaded 1/4-20 to accept store bought rod. You can attach any length rod and screw the ring down from the top to lock down just about anything. Just look at the pictures below. These are just a few applications these grips are great for. Let your imagination go to work. I'm sure you'll look at them and see a few jobs you could have used them on.

Seams with Dani Clamps
